Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene
                                                                                                  The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic cacids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for prevention and/or treatment of viral actions the component of pharmaceuticals for prevention and/or treatment of viral actions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
         CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence with, after optimal to hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probbes and primers for detecting, or identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, or production of recombinant polypeptides. Any of the nucleic acids, or collappeptides vectors containing the nucleic acids, cells containing the ceptor or antibodies directed against the polypeptides are useful for preparation, specifically cancer but also Alzheimers a disease and compation of semples is useful for the separation of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; virucide; neuroprotective; nootropic; antisense; sense; tumour; cell degeneration; cance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABT36682 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 17 BP; 2 A; 6 C; 4 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SSXS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT
The invention relates to a novel isolated 17 mer nucleic acid sequence, component in the specification, a sequence containing at least 15 consecutive comunications that least 80 % identity to the 17 mer sequence with, after optimal containing at least 18 consecutive to the last 80 % identity to the 17 mer sequence, a sequence that comprise to them under highly stringent conditions, or the complement coff any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti) sense reagents, and for component of a gene chip, in vitro as (anti) sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, collagoration of recombinant polypeptides. Any of the nucleic acids, collagoration of pharmaceuticals for prevention and/or treatment of viral conference of pharmaceuticals for prevention and/or treatment of viral conference of the sequence of the sequence and sequence of the sequence and sequence of the polypeptides are useful for constraints. Analysis of the expression of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and coth the polypeptide and antibodies are useful as components of protein contains. The nucleic acid sequence of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression coth the invention can be used in gene that an acid because of the invention can be used in gene that an acid because of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression contains contains the invention of the invention can be used in gene that the polynucleotide sequence represents a tumour suppression contains contains the invention of the invention can be used in gene that the invention can be used in gene that the invention can be used in gene can be used to generate a tumour suppression contains contains the invention can be used in gene ca

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 2436
                                  The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence hat conditions, or the complement cc frame of them under highly stringent conditions, or the complement cc acids of them, or the corresponding NNA. The novel isolated nucleic component of a gene chip, in vitro as (anti)sense reagents, and for cromponent of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, cc polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for c preparation of pharmaceuticals for prevention and/or treatment of viral cd degeneration, specifically cancer but also Alzheimer's disease and containing the active sequences of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these containing chipseptides. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chipselfied and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene characteristic by development of these can be decided the acids and components of protein chipselfied human fukutin oligonucleotide of the invention can be used in gene contained the invention can be used in gene contained the invention can be used in gene contained to components of the sequences of the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene contained to the invention can be used in gene conta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence, conversely sequence in the specification, a sequence containing at least 15 consecutive contentials from the 17 mer sequence with, after optimal conditions of them under highly stringent conditions, or the complement confides to them under highly stringent conditions, or the complement confides of the invention are useful as probes and primers for detecting, conditions of the invention are useful as probes and primers for detecting, conditions of the invention are useful as probes and primers for detecting, conditions of the invention are useful as probes and primers for detecting, conditions of the invention are useful as probes and primers for detecting, conditions of the invention as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, e.g. as one containing the vector or antibodies directed against the polypeptides are useful for configuration of pharmaceuticals for prevention and/or treatment of viral conseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and constitution of the polypeptides of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosts and/or prognosis of these contains of these contains. The nucleic acid and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene thereof the polypeptides and antibodies are useful as components of protein contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ś
RESULT 2438
ABT38938/c
                          The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cniquence, and the specification, a sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence that cc alignment, or the corresponding RNA. The novel isolated nucleic carids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cc polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for creparation of pharmacceuticals for prevention and/or treatment of viral cd diseases that are characterised by development of tumours or cell cd senticophrenia. Analysis of the expression of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and containing the polypeptide and antibodies are useful as components of these caid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene characy. This polynucleotide sequence represents a tumour suppression created human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
    The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive conditions, after optimal conditions, at least 80 % identity to the 17 mer sequence a sequence that hybridizes to them under highly stringent conditions, or the complement cof any of them, or the corresponding RNA. The novel isolated nucleic acid acids of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for corresparation of pharmaceuticals for prevention and/or treatment of viral cdiseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and containing the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these containing the polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of these characy. This polynucleotide sequence of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.

                                                                                            CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, e.g. as one CC polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell schizophrenia. Analysis of the expression of the 17 mer nucleic acids in CC diseases. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene characy. This polynucleotide sequence represents a tumour suppression of the invention can be used in gene characterises.

                             cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence containing at least 15 consecutive (CC nucleotides from the 17 mer sequence with, after optimal CC hybridizes to them under highly stringent conditions, or the complement (CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti) sense reagente, and for CC production of recombinant polypeptides. Any of the nucleic acids, ector or antibodies directed against the polypeptides are useful for cc vector or antibodies directed against the polypeptides are useful for CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell CC degeneration, specifically cancer but also Alzheimer's disease and CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these cand also be used to generate antibodies, and components of patient samples and antibodies are useful as components of protein CC chips. The nucleic acid sequences of the invention can be used in gene characterised by development of the 17 mer nucleic acid sequences of the invention can be used in gene characterised sequences of the invention can be used in gene components of protein contents of protein contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

                                                                                                                              밁
                            S
                                                                                                                                                    The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence, a sequence that configuration of the under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of these chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention

```
CC given in the specification, a sequence containing at least 15 consecutive contices in the specification, a sequence with, after optimal contices that least 80 % identity to the 17 mer sequence, a sequence that conditions to them under highly stringent conditions, or the complement configuration of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, collector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of ture to disease that are characterised by development of turours or cell diseases. The polypeptides can also be used to generate antibodies, and confict the polypeptide and antibodies are useful for chips. The nucleic acid sequences of the invention can be used in gene chips. The pulleptide and antibodies are useful as components of these characterised by development of turours or cell containing the polypeptides can also be used to generate antibodies, and confict the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression contains.

                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement CC hybridizes to them under highly stringent conditions, or the complement CC acids of the invention are useful as probes and primers for detecting, careful component of a gene chip, in vitro as (anti) sense reagents, and for CC component of a gene chip, in vitro as (anti) sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, colypeptides, vectors containing the nucleic acids, cells containing the corresponding to treatment of viral CC diseases that are characterised by development of tumours or cell CC degeneration, specifically cancer but also Alzheimer's disease and CC generation and properties is useful for diagnosis and/or prognosis of these contains and so be used to generate antibodies, and containing the servention and containing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                       diseases. The polypeptides can also we now to someonents of protein both the polypeptide and antibodies are useful as components of protein chips. The nucleit acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Amson R,

Tuijnder M

MOLECULAR ENGINES

WPI; 2003-313353/30.

Disclosure; Page 337; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence with, after optimal CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, CC dentifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, eccording to the corresponding the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC degeneration, specifically cancer but also Alzheimer's disease and CC degeneration. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these CC both the polypeptides can also be used to generate antibodies, and CC both the polypeptide and antibodies are useful as components of protein CC both the polypeptide and antibodies are useful as components of protein CC therapy. This polynucleotide sequence of the invention can be used in gene CC therapy. This polynucleotide sequence for the invention can be used in gene

CC given in the specification, a sequence containing at least 15 consecutive controllers from the 17 mer sequence with, after optimal conditions, at least 80 % identity to the 17 mer sequence, a sequence that conditions, or the complement confidered to them under highly stringent conditions, or the complement confidered in the invention are useful as probes and primers for detecting, conditions of the invention are useful as probes and primers for detecting, conditions of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, cells containing the nucleic or artibodies directed against the polypeptides are useful for comparation of pharmaceuticals for prevention and/or treatment of viral consess that are characterised by development of themours or cell containing the spharmaceuticals for prevention and/or treatment of viral consess that are characterised by development of tumours or cell containing the spharmaceuticals for prevention and/or treatment of viral consess that are characterised by development of tumours or cell containing the spharmaceuticals for proposis of these and consess that are characterised by development of tumours or cell containing the paramaceuticals of the supersist of these containing the proposis of these containing the proposition can be u
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              schizophrenia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, CC dentifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (antileense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, containing the vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell CC diseases. The polypeptides can also be used to generate antibodies, and companies is useful for diagnosis and/or prognosis of these caid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. This polynucleotide sequence represents a tumour suppression created human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                          ş

                                                                                                                                                                                                                                                                   nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell
                                                                                                            degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disgnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17-SEP-2002; 2002WO-IB004208

                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cnicentides from the 17 mer sequence, a sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement cof any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colls containing the cyetor or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cliesases that are characterised by development of tunours or cell cliesases that are characterised by development of tunours or cell containing the schizophrenia. Analysis of the expression of the 17 mer nucleic acids in Security samples is useful for diagnosis and/or prognosis of these containing the polypeptides can also be used to generate antibodies, and containing the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression correlated human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence with, after optimal to the invention are useful as probes and primers for detecting, cards of the invention are useful as probes and primers for detecting, condentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cells containing the vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral degeneration, specifically cancer but also Alzheimer's disease and containing the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene chips. This polymulaeotide sequence represents a tumour suppression containing the invention and prognosis of the generate antibodies, and containing the invention can be used to generate antibodies, and containing the invention can be used in gene containing the invention can be used in generate antibodies and in generate antibodies and tumour suppression containing the invention can be used in generate antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid, useful for treating viral diseases with tumors and cell degeneration, also related polypeptides,

Any of the nucleic acids, cells containing the correspondency vector or antibodies directed against the polypeptides are useful for conflictions of pharmaceuticals for prevention and/or treatment of viral conflictions, specifically cancer but also Alzheimer's disease and conflictions, specifically cancer but also Alzheimer's disease and conflictions are useful as components of these conflictions of these conflictions are useful as components of protein conflictions. The nucleic acid sequences of the invention can be used in gene thereof the confliction of a general confliction of the sequence represents a tumour suppression.

The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence that cc alignment, at least 80 % identity to the 17 mer sequence that cc of any of them, or the corresponding NNA. The novel isolated nucleic cc acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for cromponent of recombinant polypeptides. Any of the nucleic acids, cc polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for c preparation of pharmaccuticals for prevention and/or treatment of viral cd degeneration, specifically cancer but also Alzheimer's disease and schizohrenia. Analysis of the expression of the 17 mer nucleic acids in gatint samples is useful for diagnosis and/or prognosis of these cd diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein cc chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 560; 720pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive contident in the specification, a sequence with, after optimal conditions from the 17 mer sequence with, after optimal conditions of the sequence that the sequence is sequence to the sequence that conditions or the complement conditions, or the complement conditions, or the complement conditions, or the complement conditions of the invention are useful as probes and primers for detecting, conditions of the invention are useful as probes and primers for detecting, conditions of recombinant polypeptides. Any of the nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for convertion of pharmaceuticals for prevention and/or treatment of viral confidence or antibodies directed against the polypeptides are useful for diseases that are characterised by development of tumours or cell containing the acids in sequences of the 17 mer nucleic acids in containing the suseful for dispnosis and/or prognosis of these containing contains and containing the particle acids in containing the suseful for dispnosis and/or prognosis of these containing containing the cald sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

CC given in the specification, a sequence containing at least 15 consecutive containing to the invention are useful as probes and primers for detecting, containing the invention are useful as probes and primers for detecting, containing the invention are useful as probes and primers for detecting, containing the component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for consolitation of recombinant polypeptides. Any of the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for consparation of pharmaceuticals for prevention and/or treatment of viral consease that are characterised by development of tumours or cell containing the schizophrenia. Analysis of the expression of the 17 mer nucleic acids in constitution of the polypeptides and antibodies are useful for conseases. The polypeptides can also be used to generate antibodies, and conspands of these conseases. The polypeptide and antibodies are useful as components of these conseases. The polypeptide and antibodies are useful as components of these conseases. The polypeptide and antibodies are useful as components of protein conseases. The nucleic acid sequence of the invention can be used in gene consease conseases conseased and consease and conseases and conseases conseased and conseases conseased and consease and conseases conseased and conseases conseased and conseases conseased and conseased and consease conseased and c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive conditions at least 16 and the first part of the 17 mer sequence with, after optimal conditions or the complement conditions, or the complement conditions or the complement conditions, or the complement conditions or the complement conditions, or the complement of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, collypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for conditions of pharmaceuticals for prevention and/or treatment of viral conditions are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and conditions are useful as components of these conditions. The nucleic acid sequences of the invention can be used in gene characy. This polynucleotide sequence represents a tumour suppression conditions.

The nucleic acid sequences of the invention can be used in gene characy. This polynucleotide sequence of the invention can be used in gene conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 2457
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 555; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive conditions of the intention are useful as greence with, after optimal conditions or the complement conditions or the complement conditions or the complement conditions, or the complement conditions of the invention are useful as probes and primers for detecting, conditions of recombinant polypeptides. Any of the nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for components of paramaccuticals for prevention and/or treatment of viral conditions and all containing the vector or antibodies directed against the polypeptides are useful for components of paramaccuticals for prevention and/or treatment of viral conditions are consistent and containing the viral conditions. Analysis of the expression of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and containing the polypeptides and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene contained the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cc nucleotides from the 17 mer sequence, a sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence that cc hybridizes to them under highly stringent conditions, or the complement cc fany of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the vector or antibodies directed against the polypeptides are useful for creparation of pharmaccuticals for prevention and/or treatment of viral cd degeneration, specifically cancer but also Alzheimer's disease and containing the schizophrenia. Analysis of the expression of the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and contains the polypeptide and antibodies are useful as components of these caid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene characterised by development as components of protein contains. The polypeptide and antibodies are useful as components of protein contains. The polypeptide sequences of the invention can be used in gene characterised by development as components of protein contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
  New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

cc nucleotides from the 17 mer sequence, a sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement cof any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, ci identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, copypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cdiseases that are characterised by development of tumours or cell cdiseases that are characterised by development of tumours or cell containing the 17 mer nucleic acids in containing the 17 mer nucleic acids in containing the polypeptides can also be used to generate antibodies, and corporate antibodies, and senses. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene characterised by development of tenses. The polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene cut therapy. This polynucleotide sequence represents a tumour suppression con the invention can be used in gene cut the polyment of the sequence of the invention can be used in gene cut the polyment of the sequence of the invention can be used in gene cut the polyment of the sequence of the invention can be used in gene cut the polyment of the sequence of the invention can be used in gene cut the polyment of the sequence of the invention can be used in gene cut the polyment of the component of the invention can be used in gene cut the polyment of the component of the invention can be used in gene cut the polyment of the comp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cc nucleotides from the 17 mer sequence, a sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence, a sequence that cc hybridizes to them under highly stringent conditions, or the complement cc fany of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for cc polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for cc preparation of pharmaceuticals for prevention and/or treatment of viral cdiseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and cc patient samples is useful for diagnosis and/or prognosis of these chips. The nucleic acid sequences of the invention can be used in gene therapy. This polypeptide can also be used to generate antibodies, and chips. The nucleic acid sequences for the invention can be used in gene therapy. This polypeptide can also be used to generate antibodies, and components of these characterises of the invention can be used in gene therapy. This polypeptide can also be used to generate antibodies, and components of these can be useful as components of protein components of these can be useful as components of the cancer than the components of the cancer than

```
CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridzes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding RNA. The novel isolated nucleic CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, CC polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral CC degeneration, specifically cancer but also Alzhaimer's disease and CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in CC patient samples is useful for diagnosis and/or prognosis of these CC chips. The polypeptides can also be used to generate antibodies, and containing the invented and antibodies are useful as components of protein containing the invented acid sequences of the invented can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 2462

New isolated nucleic acid, useful for treating viral diseases with tumors and cell degeneration, also related polypeptides, transfected cells. associated antibodies

Page 43; 720pp; French

The invention relates to a novel isolated 17 mer nucleic acid sequence given in the specification, a sequence containing at least 15 consect nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence hybridizes to them under highly stringent conditions, or the compleme , a sequence that the complement sequence, consecutive

> 88888888888888888888888 CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying anucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, CC polypeptides, vectors containing the nucleic acids, cells containing the cettor or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC degeneration, specifically cancer but also Aliheimer's disease and CC degeneration, specifically cancer but also Aliheimer's disease and CC diseases. The polypeptides can also be used to generate antibodies, and CC diseases. The polypeptide and antibodies are useful as components of these CC both the polypeptide and antibodies are useful as components of protein CC chips. The nucleic acid sequences of the invention can be used in gene CC therapy. This polynucleotide sequence represents a tumour suppression CC related human fukutin oligonucleotide of the invention of any of them, acids of the inv or the corresponding RNA. The novel isolated nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, CC polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell CC degeneration, specifically cancer but also Alzheimer's disease and CC estimated and the expression of the 17 mer nucleic acids in CC diseases. The polypeptides can also be used to generate antibodies, and CC diseases. The polypeptide and antibodies are useful as components of protein CC chips. The nucleic acid sequences of the invention can be used in gene CC therapy. This polynucleotide sequence represents a tumour suppression CC related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated mucleic acids of the invention are useful as probes and primers for detecting, identifying quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for

given in the specification, a sequence containing at least 15 consecutive mucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence the hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as graph and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                               17-SEP-2001;

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as RNA and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one production of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diseases and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chips. The nucleic acid sequences of the invention suppression therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; virucide; neuroprotective; nootropic; antisense; sense; tumour; cell degeneration; cance schizophrenia; protein chip; gene therapy; tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                 The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell
                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17 BP; 4 A; 6 C; 3 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                      The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, oppoppitides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           17-SEP-2001; 2001FR-00011978

The invention relates to a novel isolated 17 mer nucleic acid sequence, conversely sequence in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence, a sequence that they identified to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, conditioning, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense respents, and for production of recombinant polypeptides. Any of the nucleic acids, collypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the immours or cell contains samples is useful for diagnosis and/or prognosis of these contains and several as the polypeptides can also be useful as components of protein both the polypeptide and antibodies are useful as components of protein

The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polymucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention

         The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC dids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti) sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, containing the CC polypeptides, vectors containing the nucleic acids, cells containing the CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC degeneration, specifically cancer but also Alzheimer's disease and CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in generate antibodies, and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                 The invention relates to a novel isolated 17 mer nucleic acid sequence, is given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of vital diseases that are characterised by development of tumours or cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

            degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABT37770 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17 BP; 3 A; 4 C; 8 G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SS
                        CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding NNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC production of recombinant polypeptides. Any of the nucleic acids, cgl scontaining the vector or antibodies directed against the polypeptides are useful for CC proparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell CC diseases. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the 17 mer nucleic acids in CC diseases. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene CC related human fukutin oligonucleotide of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disschizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid, useful with tumors and cell degeneration, and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-SEP-2001; 2001FR-00011978

                      Cg jiven in the specification, a sequence containing at least 15 consecutive containing at least 15 consecutive containing at least 15 consecutive dispirations at least 17 mer sequence, a sequence with, after optimal conditions, to them under highly stringent conditions, or the complement conditions, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for conditions, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for components of parameterized by development of the nucleic acids in conditions, specifically cancer but also Alzheimer's disease and conditions, specifically cancer but also Alzheimer's disease and conditions, and the polypeptides can also be used to generate antibodies, and conditions. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                               The invention relates to a novel isolated 17 mer nucleic acid sequence, containing at least 15 consecutive contentials at least 15 consecutive contentials at least 15 consecutive contentials at least 180 % identity to the 17 mer sequence, a sequence with, after optimal contentials at least 80 % identity to the 17 mer sequence, a sequence that configuration of them, or the corresponding RNA. The novel isolated nucleic contentials of the invention are useful as probes and primers for detecting, contentifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for component of recombinant polypeptides. Any of the nucleic acids, collypeptides, vectors containing the nucleic acids are useful for confountion of pharmaceuticals for prevention and/or treatment of viral configuration of pharmaceuticals for prevention and/or treatment of viral configuration, specifically cancer but also Alzheimer's disease and confountient samples is useful for diagnosis and/or prognosis of these contained by development of these contained by cancer but also Alzheimer's disease and conformation the polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein contains nolympial and sequences of the invention can be used in gene of the sequence of the invention can be used in gene contains. The nolympial accomponents of protein contains nolympial accomponents of protein contains and protein can be used to generate antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                           cc alignment, at least 80 % identity to the 17 mer sequence, a sequence with after optimal cc alignment, at least 80 % identity to the 17 mer sequence, a sequence that cc hybridizes to them under highly stringent conditions, or the complement cof any of them, or the corresponding RNA. The novel isolated nucleic cc acids of the invention are useful as probes and primers for detecting, ci identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, collection of parameterises of the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral cd diseases that are characterised by development of tumours or cell cd diseases that are characterised by development of tumours or cell cd degeneration, specifically cancer but also Alzheimer's disease and cc schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The nucleic acid sequences of the 17 mer nucleic acid soth the polypeptide can an also be used to generate antibodies, and coips. The nucleic acid sequences of the invention can be used in gene cc therapy. This polynucleotide sequence represents a tumour suppression cc related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid, useful i with tumors and cell degeneration, and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated 17 mer nucleic acid sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 350; 720pp; French.

                                                                                                                                                                                 CC given in the specification, a sequence containing at least 15 consecutive CC nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC of any of them, or the corresponding NNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC production of recombinant polypeptides. Any of the nucleic acids, component of a gene chip, in vitro as (anti)sense reagents, and for CC production of recombinant polypeptides. Any of the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for CC preparation of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell CC diseases that are characterised by development of tumours or cell containing the polypeptides of the expression of the 17 mer nucleic acids in CC diseases. The polypeptides can also be used to generate antibodies, and CC diseases. The polypeptide and antibodies are useful as components of these chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene characteristics.
                                                                           Matches
                                                                                                                Query Match
                                                                                                                                                                               therapy. ...
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression; human fukutin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies

```

inhibitor;

Novel enzymatic nucleic acid molecules which down regulates expression a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 32; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down cregulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor ckappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat the cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and cantisense nucleic acid molecules are useful for treating breast, lung, corostate, colorectal, brain, oceophageal, stomach, bladder, pancreatic, comiltidrug resistant cancer. The method involves use of other drug chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carbolatin, edatrexate, cyclophosphamide, cyclophosphamid rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, gemeitabine or radiation therapy. The enzymatic and antisense nucleic gemeitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ঠ
                                               The present invention relates to novel human zinc finger-containing CC proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is CC encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome CC 15q26.1. The MD23, MD24, MD27, and MD212 is encoded at chromosome CC or in manufacturing a medicament for treating or preventing a disorder CC associated with decreased or increased expression or activity of MD23, CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic CC acids and proteins are also useful for diagnosing or monitoring a disease CC caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic CC acids can also be used as probes to detect and characterize gross CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The CC proteins are useful as therapeutic agents for gene therapy or as CC vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7g22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 1sp1.2 and MDZ12 is encoded at chromosome 1sp2.6.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 and probes are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                          Sequence 17
                                                                                                                                                                                                                                                      useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    02-AUG-2001; 2001US-00922181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     30-JUL-2002; 2002EP-00016874
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            05-FEB-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ7; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer;

                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to novel human zinc finger-containing CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p21.2 and MDZ12 sequences are useful in therapy, CC associated with decreased or increased expression or activity of MDZ3, CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic CC acids and proteins are also useful for diagnosing or monitoring a disease CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic CC acids can also be used as probes to detect and characterize gross CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are CC useful in constructing microarrays for measuring gene expression. The CC proteins are useful as therapeutic agents for gene therapy or as CC vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                      Query Match

The present invention relates to novel human zinc finger-containing corpoteins and their coding sequences; MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, CMDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome corporate in manufacturing a medicament for treating or preventing a disorder corporated with decreased or increased expression or activity of MDZ3, CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic caids and proteins are also useful for diagnosing or monitoring a disease coded by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic caids can also be used as probes to detect and characterize gross calterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are cuseful in constructing microarrays for measuring gene expression. The corporations are useful as therapeutic agents for gene expression. The corporations are useful as therapeutic agents for gene therapy or as constructions.
